AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1. (cancelled)
- 2. (previously amended) A process for continuous coagulation and drying of rubber latex, comprising passing a stream of the latex through a coagulator to form a coagulated rubber stream, wherein a coagulation temperature in the coagulator is in the range from 30°C to 90°C, introducing the coagulated rubber stream from the coagulator into a dryer downstream of the coagulator, and passing the coagulated rubber stream through the dryer to dry the rubber, in which the latex stream in the coagulator is heated by a combination of microwave energy and hot air.
- 3. (original) A process as claimed in claim 1, wherein the latex stream entering the coagulator has a thickness in the range from 1.0 mm to 15.0 mm.
- 4. (original) A process as claimed in claim 1, wherein the coagulated rubber in the dryer is heated by a combination of microwave energy and hot air.
- 5. (original) A process as claimed in claim 4, wherein the rubber is dried to a moisture content of less than 1.5%.
- 6. (original) A process as claimed in claim 1, wherein the latex stream speeds, rubber temperatures and microwave energy consumption are computer-controlled.

- 7. (original) A process as claimed in claim 1, further including stretching the coagulated rubber stream passing between the coagulator and the dryer.
- 8. (original) A process as claimed in claim 7, wherein the coagulated rubber steam is stretched by increasing its speed of conveyance to the dryer.
- 9. (original) An apparatus for continuous coagulation and drying of rubber latex, comprising a coagulator, a first feeder to pass a stream of latex through the coagulator to form coagulated rubber, a primary heater operable to provide a combination of microwave energy and hot air to coagulated the latex stream passing through the coagulator, a dryer to receive the coagulated rubber stream from the coagulator, a second feeder to pass the coagulated latex stream through the dryer, and a secondary heater to dry the coagulated rubber passing through the dryer.
- 10. (original) An apparatus as claimed in claim 9, wherein the primary heater is operable to provide a coagulation temperature in the range from 30°C to 90°C.
- 11. (original) An apparatus as claimed in claim 9, wherein the first feeder is a conveyer belt.
- 12. (original) An apparatus as claimed in claim 11, wherein the conveyor belt is coated with polytetrafluoroethylene (PTFE).
- 13. (original) An apparatus as claimed in claim 9, wherein the secondary heater is operable to provide a combination of microwave energy and hot air.
- 14. (previously presented) An apparatus as claimed in claim 9, wherein the second feeding means is a conveyor belt.

- 15. (original) An apparatus as claimed in claim 14 in which the second feeding means is a plurality of conveyor belts arranged so that the coagulated rubber is passed from one belt to the other.
- 16. (original) An apparatus as claimed in claim 15, wherein at least one of the belts is coated polytetrafluoroethylene (PTFE).
- 17. (original) An apparatus as claimed in claim 9, further including a stretch unit for the coagulated rubber stream leaving the coagulator.
- 18. (original) An apparatus as claimed in claim 17, wherein the stretch unit is operable to increase the speed at which the coagulated rubber stream leaves the coagulator.
- 19. (original) An apparatus as claimed in claim 17, wherein the stretch unit comprises a conveyor belt configured to receive the coagulated rubber leaving the coagulator and to pass the coagulated rubber to the dryer.
- 20. (original) An apparatus as claimed in claim 19 in which the belt is coated with polytetrafluoroethylene (PTFE).
- 21. (original) In a process for the continuous coagulation and drying of rubber latex, the improvement comprising heating a latex_stream in a coagulator by a combination of electromagnetic and heated gas.
- 22. (original) In an apparatus for the continuous coagulation and drying of rubber latex, the improvement comprising heating apparatus first to coagulate a latex stream with a combination of electromagnetic energy and heated gas and second to dry the coagulated latex stream.
- 23. (New) A process according to claim 1, wherein the latex stream entering the coagulator is carried on a conveyer belt.
